Bosch I recently installed a set of French doors in my apartment. The jams were plums, the finish looked great. Everything was fine until I closed the doors. Where they met in the middle, they actually met. I could close them, but only if I made them. When I consulted with the PM's senior home editor, Roy Berenson, he told me it was a common problem. Remove a little wood from the edge of the offending door and I would be good to go. How do you do that? A manual plane. , manual plane. The home god of traditional woodworking tools. A simple but terrible cutter, a beveled blade of fine smoothing and capricious adjustment. I bought a hand-held plane once, a long time ago, because I needed to shave the pantry shelf, which was too high for the spice rack I wanted to put on it. Fortunately, Roy had an ace up his sleeve. He lent me a new wireless 12V by Max Glider Bosch. This identifiable manual plane - the bottom - is a smooth surface with a small window for cutting implementation. But instead of a cutting iron, which the user should adjust, there is a rotating cutter, the depth of which is adjusted by a simple handle in the front - in the same place as the handle on the traditional manual plane. From there, Bosch improved its conventional grip on the hand-held aircraft. Instead of a vertical clutch at the back of the aircraft (the so-called tote), Max Planer has a horizontal grip with a gun. It's convenient, and because that's where the battery goes, it has some weight. I brought Bosch home and take a look at my

doors. The glider is 2.2 inches wide, easy enough for this project. I got one door off the hinges, set it on the edge, and square the glider on the side that needed to lose the material. Then I turned the handle on top to adjust the depth of the cutting. It reaches a maximum finish of only 2 millimeters, but that was enough. I oppressed security with my thumb, pulled the trigger with my index finger and made a smooth passage from one end of the door to the other. With the exception of the node area, what I got was a lovely, smooth edge. After a few passes, I put the door back on the hinge. It closed perfectly. Bosch It was a manual aircraft that I could use. It was a manual aircraft that anyone could use. I wish the chip collection was a little better, but it's a problem with every cutting tool. At the very least, Max Planer lets you choose which side the chip is emitted on, so cleaning is a little easier to plan. My only other complaint is that the battery does not last any longer. It is designed for 33 feet of planning in hardwood at half the maximum depth of the instrument. This is more than enough to repair the doors, but if I would take on a more significant woodworking that I could, with this thing in hand, it can go fast. Anyway, I'm going to try not to pass it on to Roy. This content is created and supported by a third party, and This page to help users provide their email addresses.
